

Aster's Cartoon Live Performance : Installation

What I bring :

- A visualizer model *WolfVision VZ-8+*. It allows filming a hand-made drawing to show it on a screen. This device is aimed to be connected to a beamer. Here is a picture of the outputs:

Resolution : 1024x768 - 60hz XGA

TRANSFO

What I need

- A work place on a table or in the Production room, or in the main room, in a discrete place from where I can see and hear the speakers. A tablecloth would stifle the sound of the markers hitting the table...

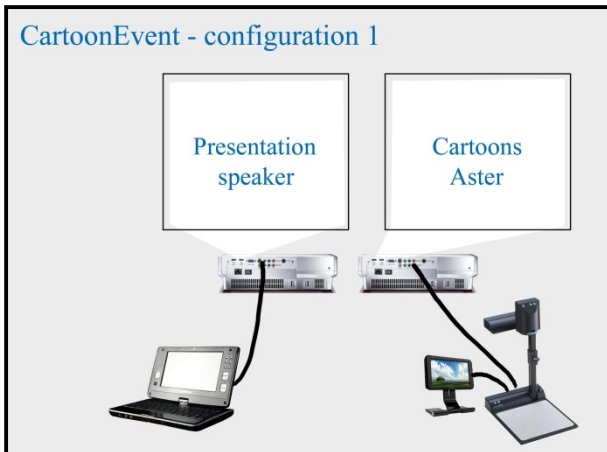

- A good connectivity between the visualizer and the beamer : through the DVI output (with or without HDMI adaptor).

- a control mean of the signal that is sent to the beamer : I must be able to create a surprise effect by projecting rapidly a cartoon in the middle of a presentation and quickly switch back to it.

If one screen and one beamer are dedicated only to the drawings, then I should control it easily via a remote control box, a hand sign to the Producer or manual occultation of my camera - configuration 1

If there is only one beamer for both sources, we should control perfectly the shift from one to another. Therefore we need a switch, controlled by me directly, or by the Producer – configuration 2

CartoonEvent - configuration 1

CartoonEvent - configuration 2

When the occurrence of my pictures depends on a Producer, I must be closely connected to him (by an intercom or by the view). The less intermediaries, the shortest way and the simplest system are the best.

Let's also think about :

- Electricity outputs (3)
- Translation headphones, in case of translation
- A return monitor for the speakers; so they can see the monitor without having to turn their back to see the screen

What I can provide

VGA switch, HDMI switch, 10/15/20 m. VGA cables, short HDMI cables, 2 m. wide screen. DVI→HDMI adaptor.

In case of any further question, please phone me directly:
